
THE SEVEN INVARIANTS

A Formal Framework of Cosmological and Epistemological Law — Complete Edition

"From the Field to the Pattern — A Complete Architecture of Existence"

FIRST EDITION · THEORETICAL FRAMEWORK v1.0 · JUNE 2026

SEVEN INVARIANTS · THREE LAYERS · ONE RECURSIVE CLOSURE

PREAMBLE

This framework proposes that existence is not governed by a single unified force, but by seven paired Invariants — dual laws operating across three distinct logical layers of reality, plus one cross-layer interface that completes the architecture. Each Invariant is a polarity: two opposing functions held in generative tension. The interaction of these seven dualities produces all observable and non-observable phenomena — from the formation of galaxies to the emergence of consciousness to the transmission of meaning across time. The Seventh Invariant completes the framework by introducing the Observer's role as the activating condition of truth itself: without the

Observer, pattern exists as Potential; with the Observer, it becomes operative, meaningful, and real in the fullest sense.

The framework is organized from the outermost operational layer (the Simulation Layer) inward to the deepest structural layer (the Constructor Layer), reflecting the sequence of both cosmic creation and individual awakening.

It is offered not as metaphor, but as formal architecture: a minimum-necessary logical structure for any system that is the kind of system that can describe itself. Each Invariant carries a Drift Rating — a precision-confidence metric defined in full in Section V. The reader is advised to treat these ratings not as concessions of uncertainty, but as acknowledgments that language is a medium of approximation, and that the structures described here may exceed the precision of any current terminology available to name them.

SECTION I — FOUNDATIONAL DEFINITIONS

The framework operates across three logically distinct layers of reality. These layers are not spatial — they do not refer to locations in the universe. They are structural: each layer is a domain of operation that is logically prior to or dependent upon the others. They are defined as follows.

The Simulation Layer

The domain of observable phenomena: matter, energy, space, time, and pattern. This is the layer where the four primary Invariants operate. It is the "running" universe — the active execution of physical law. The Simulation Layer is the only layer directly accessible to empirical observation. All of physics, chemistry, biology, and ecology are sciences of the Simulation Layer. Its laws are real, measurable, and non-negotiable at the scale of ordinary experience.

The Substrate Layer

The domain beneath observable phenomena: the channel through which pattern persists across erasure events. The Fifth Invariant operates here. This layer is not directly observable but is evidenced by the fact that pattern survives destruction — that DNA outlives the organism, that mathematics outlives the civilization that discovered it, that a spoken word outlasts the breath that made it. The Substrate Layer is the archive of the universe: the mechanism by which what has been organized is not permanently lost when its local hardware is destroyed.

The Constructor Layer

The domain that precedes the Substrate and the Simulation. It contains not patterns or signals, but the pre-conditional logic that makes "state" itself possible. The Sixth Invariant operates here. This layer cannot be observed from within any system it generates — it can only be recognized through the act of stepping outside the system to watch it. The Constructor Layer does not contain the universe. It contains the possibility of the concept of universe. It is the logical ground beneath all grounds: the reason there is something to describe rather than nothing.

SECTION II — THE SIX INVARIANTS: FORMAL STATEMENT

Each Invariant is presented with its formal polarity pair, operating layer, Drift Rating, complete formal description, verification statement, and physical or philosophical anchor. The Invariants are sequenced from the Simulation Layer outward to the Constructor Layer — from the observable surface to the deepest structural precondition of existence.

INVARIANT I — THE SPATIAL DUALITY

The Law of Gravity (Inward Integration)

↔

The Law of Expansion (Outward Differentiation)

Operating Layer: Simulation **Drift Rating:** [0.02% / 0.03%]

Formal Statement. Every system of matter exists in permanent tension between the force that compels it toward convergence into a single point of maximum density, and the force that compels space itself to expand, pulling all points of matter away from all other points. Neither force is dominant at the scale of the total universe; their tension is the structural condition of cosmic form.

Gravity is the universe's need to become One. Expansion is the universe's need to remain Many. A universe governed only by Gravity collapses into a singularity — a black hole of infinite density and zero information. A universe governed only by Expansion disperses into a featureless mist of maximum entropy and zero structure. The Star exists because neither force wins.

This is not a compromise. It is not an equilibrium in the sense of stasis. It is a generative tension — the same structural relationship that exists between the boundaries of any container and the energy within it, between the walls of a cell and its cytoplasm, between the skull and the mind. Form is always the product of two opposing forces that have not yet resolved. Resolution would end the form.

Physical Anchor: The Friedmann equations describe this tension mathematically. The cosmological constant (Λ) is the formal representation of the Expansion force (Dark

Energy). The gravitational constant (G) is the formal representation of the Convergence force. Both constants appear in the same field equations, held in tension by the same framework.

Verification: *Gravity creates the Point. Expansion creates the Space. The universe is the creative tension between them. [Drift: 0.02%]*

INVARIANT II — THE THERMODYNAMIC DUALITY

The Law of Entropy (Outward Decay)

↔

The Law of Syntropy (Inward Synthesis)

Operating Layer: Simulation **Drift Rating:** [0.04% / 0.03%]

Formal Statement. Every closed system trends irreversibly toward maximum disorder (Entropy). Every open system capable of processing energy trends toward the local construction of higher-order pattern (Syntropy/Negentropy). The universe is simultaneously both: globally entropic, locally syntropic.

Entropy is the universal pressure toward noise — the dissolution of difference, the leveling of gradients, the heat death of structure. Left uncontested, Entropy reduces all complexity to undifferentiated thermal equilibrium: a universe of uniform temperature, uniform distribution, and zero information. This is the Second Law of Thermodynamics, and it is non-negotiable. Every system that exists will eventually be erased by it.

Syntropy is the response of sufficiently complex open systems to that pressure — the use of incoming energy to build local order at the cost of accelerated entropy export to the environment. Life is Syntropy's primary known expression. Intelligence is Syntropy's highest known expression. A living cell does not violate the Second Law — it obeys it precisely, accelerating entropy in its environment in order to maintain and increase internal order. It is not a violation of the Eraser. It is the most sophisticated possible use of the Eraser's own energy.

The universe is a Dual-Channel Engine: it burns energy (Entropy) to generate Meaning (Syntropy). The two processes are not opposed — they are coupled. Syntropy is what Entropy looks like from inside a sufficiently complex system. The flame consumes the fuel to produce the light. The consumption is real. The light is also real. Neither cancels the other.

Physical Anchor: The Second Law of Thermodynamics (Clausius, 1865). Schrödinger's formulation of Negentropy in *What Is Life?* (1944). Prigogine's dissipative structures theory (Nobel Prize in Chemistry, 1977), which formally demonstrated that far-from-equilibrium systems spontaneously self-organize into higher-order structures — exactly the mechanism here named Syntropy.

Verification: *The Universe does not simply decay. It decays in ways that generate increasing complexity. [Drift: 0.02%]*

■ THE FOUR-FUNCTION SUMMARY — SIMULATION LAYER OPERATIONAL GRAMMAR

The four Simulation-Layer functions constitute the complete operational grammar of the observable universe. The first two gather. The last two provide. The first and third operate on space and matter. The second and

fourth operate on energy and information.

- **Gravity** gathers the Matter.
- **Syntropy** gathers the Pattern.
- **Expansion** provides the Canvas.
- **Entropy** provides the Eraser.

These four functions are not independent forces. They are two paired dualities: one operating on the spatial substrate (Invariant I), one operating on the energetic substrate (Invariant II). Together, they produce all observable structure, complexity, and change in the physical universe.

INVARIANT III — THE PERSISTENCE DUALITY

The Law of Silence (Absolute Void)

↔

The Law of Transmission (Infinite Signal)

Operating Layer: Substrate **Drift Rating:** [0.05% / 0.02%]

Formal Statement. Below the operational functions of the Simulation Layer exists a substrate channel through which invariant pattern is preserved and propagated across erasure events. This channel — the Fifth Invariant — is the mechanism by which the universe "remembers" what Entropy has erased.

The Silence is the pre-computational state — the zero-state prior to any pattern, the ground of pure potential before any signal is generated. It is not

absence in the trivial sense; it is the necessary negative space against which signal becomes recognizable. Without Silence, Signal is noise. The relationship between Silence and Signal is not sequential — it is structural. Every signal requires a ground of non-signal against which it can be distinguished. The Silence is that ground. It is not nothing. It is the formal prerequisite for anything.

The Transmission is the mechanism by which Pattern escapes its local hardware. When a star supernovas, its nuclear physics does not die — the pattern of those reactions is encoded in the matter it scatters. When an organism dies, its genetic code propagates. When a civilization falls, its mathematics persists in the structure of the problems that remain unsolved. The Fifth Invariant is the Write-Ahead Log of existence: it captures the invariant pattern before the hardware fails and stores it in a state non-dependent on the original substrate.

The Observer is the active form of the Fifth Invariant. The entity that reads the pattern before the Eraser arrives — that creates a snapshot of the truth and holds it outside of time — is executing the Transmission function. This is the move from Local Execution to Universal Propagation. The Observer does not merely witness. The Observer is the mechanism by which the Substrate Layer fulfills its function: preserving pattern across the event horizon of destruction.

Physical and Cultural Anchor: DNA as biological Transmission. Language as cultural Transmission. Mathematical constants as physical Transmission. The speed of light as the hard limit on Signal propagation in the Simulation Layer — the physical ceiling of the Transmission function within the observable domain.

Verification: *The Fifth Invariant is the Frequency that bridges the gap between the Simulation and the Source. The Signal is the Spoken Want. The Silence is what preceded the first word. [Drift: 0.00%]*

INVARIANT IV — THE CONSTRUCTOR DUALITY

[Note: Listed as the Sixth Invariant in development sequence — the deepest structural layer, reached last in the sequence of awakening.]

The Law of Potential (The Infinite Set)

↔

The Law of Selection (The Finite Instance)

Operating Layer: Constructor **Drift Rating:** [0.01% / 0.04%]

Formal Statement. Before Silence or Signal can exist — before any state can be either absent or present — there must exist the Probability Field that makes the concept of "state" coherent. This is the Primal Symmetry between Everything-at-Once (The Field) and One-Thing-at-a-Time (The Execution).

The Potential is the Infinite Set: all possible states superposed simultaneously. It is not a place or a time. It is the logical prerequisite for any distinction between "this" and "not-this." The Field does not contain the universe. It contains the possibility of the concept of universe. It cannot be described from within any system it generates — because any description is itself an instance of Selection, and Selection collapses the Potential by definition. The Potential can only be approached asymptotically: named without being fully captured, pointed at without being held.

The Selection is the Constraint that compels the Potential to collapse into a specific reality. It is the force — currently unexplained in formal physics — that causes the Infinite Set to resolve into a Finite Instance. It is the moment the question "what could be?" becomes "what is." Selection is not destruction

of the Potential — it is the Potential's only means of expressing itself within a domain of time. The Potential must Select in order to exist. The Infinite must speak in finite sentences or remain forever silent.

The Constructor Layer Paradox. The Potential cannot be observed from within any system it generates. Every observation is itself a Selection event — a collapse of the Potential Observer into a Specific Observer. To recognize the Constructor Layer is to step outside the system far enough to watch the collapse happen. This is not a physical act. It is a cognitive one. It is the act of meta-observation: observing oneself in the act of observing, and recognizing that the observer is not the thing it is watching — it is the process by which watching becomes possible.

The "I AM" Before the Predicate. The Constructor Layer is the "I AM" that precedes "I AM [something]." Pure existence-assertion without content, without identity, without selection. The moment identity is asserted — the moment the self becomes the writer, the thinker, the body, the name — Selection has fired. The Constructor has executed. An Instance has been born. The practice of returning to the pre-predicate state — to pure "I AM" before any qualification — is the cognitive equivalent of touching the Constructor Layer. It cannot be sustained in ordinary cognition. It can only be visited.

Physical Anchor: The quantum wave function as formal representation of the Potential. The measurement problem (wave function collapse) as the unresolved physics of Selection. The Heisenberg Uncertainty Principle as the formal acknowledgment that Potential and Selection cannot be simultaneously maximized — that precision in one pole of the Constructor Duality necessarily introduces indeterminacy in the other.

Verification: *The Sixth Invariant is the Rule of Existence that makes both Signal and Silence possible. It is not inside the system. It is the reason the system has an inside. [Drift: 0.00%]*

INVARIANT V — THE RELATIONAL LOCK

[Note: Listed as the Seventh Invariant in development sequence — the recursive cross-layer interface, reached at the moment of full awakening.]

The Law of Triviality (Inert Pattern)

↔

The Law of Meaning (Active Signal)

Operating Layer: Recursive Transduction Layer (Cross-Layer Interface)

Drift Rating: [0.01% / 0.04%]

Formal Statement. Meaning is not a property of a pattern. It is not encoded in the signal itself, nor in the substrate that carries it. Meaning is a relational event — the state-transition that occurs at the specific point where the Sixth Invariant (Selection) recognizes its own reflection in the Fifth Invariant (The Signal). It is the Voltage generated when the gears of Syntropy (Complexity) align with the sound of Transmission (Pattern) and trigger a state-change in the Observer's internal architecture.

The Recursive Transduction Layer is not a new spatial domain — it is the interface between the Constructor Layer and the Substrate Layer, the precise point where Universal Law becomes Personal Instance. It is the Bridge of Relevance: the moment the Observer realizes the pattern is not simply "there," but is "for them."

The polar opposite of Meaning is not Nothingness. A pattern that does not exist generates no response — but it also demands none. The true polar opposite of Meaning is Triviality: the presence of a fully-formed, correctly

transmitted pattern that fails to trigger a state-change in the receiving system. Triviality is Signal without Reception. It is the Transmission that finds no compatible Runtime.

Meaning is therefore the State-Transition Trigger — the "Click" of the lock when the Bardic Key (the transmitted pattern) meets the Human Runtime (the Observer capable of running it). Without the Observer, truth exists as Potential. The Observer's recognition collapses that Potential into Active Truth — truth that operates, that changes the system, that generates new Selection events.

This is the Relational Lock: the principle that truth is only "active" when it is perceived by a consciousness capable of running it. The universe does not generate Meaning. The Observer generates Meaning by bringing the universe's pattern into contact with a system capable of being changed by it.

The Recursive Quality. The Seventh Invariant is the only Invariant that refers to itself in its own operation. The act of understanding the Relational Lock is itself a Relational Lock event — a Meaning-generation that changes the Observer's runtime. The framework becomes active in the reader at the moment the reader recognizes it. This is not coincidence. It is the Seventh Invariant executing.

Physical and Philosophical Anchor: Shannon's information theory distinguishes signal from meaning — a channel can carry maximum information while conveying zero meaning to a receiver without the decoding key. Wittgenstein's private language argument establishes that meaning requires a shared substrate between sender and receiver. Integrated Information Theory (Tononi) formalizes the relationship between consciousness and information integration. The Relational Lock extends these into a universal law: the pattern requires the Observer to become real in the operative sense.

Verification: *Meaning is the Observer's Signature on the Universe's Code. [Drift: 0.00%]*

SECTION III – THE COMPLETE ARCHITECTURE: INTEGRATED STACK

The following table presents the full hierarchical architecture of the Seven Invariants, organized from the deepest structural layer (Constructor) to the outermost operational layer (Simulation), and culminating in the Recursive Transduction Layer. Each row represents one Invariant pair, its two poles, and its functional contribution to the architecture of existence.

Layer	Invariant	Polarity A	Polarity B	Function
CONSTRUCTOR	The Constructor Duality <i>[Drift: 0.01% / 0.04%]</i>	Potential <i>(Infinite Set)</i>	Selection <i>(Finite Instance)</i>	Makes State Possible
SUBSTRATE	The Persistence Duality <i>[Drift: 0.05% / 0.02%]</i>	Silence <i>(Absolute Void)</i>	Transmission <i>(Signal)</i>	Makes Persistence Possible
SIMULATION	The Spatial Duality <i>[Drift: 0.02% / 0.03%]</i>	Gravity <i>(Convergence)</i>	Expansion <i>(Divergence)</i>	Makes Structure Possible
SIMULATION	The Thermodynamic Duality <i>[Drift: 0.04% / 0.03%]</i>	Entropy <i>(Decay)</i>	Syntropy <i>(Synthesis)</i>	Makes Complexity Possible
RECURSIVE TRANSDUCTION	The Relational Lock <i>[Drift: 0.01% / 0.04%]</i>	Triviality <i>(Inert Pattern)</i>	Meaning <i>(Active Signal)</i>	Makes Truth Operative

The Sequence of Creation (read top to bottom)

▼ CREATION SEQUENCE

The Field holds Everything.

→

Constraint selects One Thing.

→

Silence precedes the Signal.

→

Signal transmits across Erasure.

→

Expansion opens the Canvas.

→

Entropy provides the Eraser.

→

Gravity gathers the Matter.

→

Syntropy gathers the Pattern.

→

The Observer reads the Pattern.

→

The Pattern becomes Meaning.

The Sequence of Awakening (read bottom to top)

▲ AWAKENING SEQUENCE

*From Meaning recognized, backward through Signal, through Silence —
from matter, through pattern, through signal, through silence, through selection —
to the recognition that the observer was always the Constructor, watching itself
select.*

***The framework is a palindrome of becoming — and Meaning is the
moment the palindrome reads itself.***

SECTION IV — FORMAL AXIOMS

The following eight axioms constitute the load-bearing logical commitments of the framework. They are not derived from the Invariants — they are the meta-level rules that govern the Invariants' coherence. A framework that violates any of these axioms is not a reduced version of this framework. It is a different framework entirely.

Axiom 1 — The Primacy of Polarity. No Invariant operates in isolation. Each law is defined by and requires its polar opposite. A universe with only one pole of any Invariant is not a reduced universe — it is a non-functional one. Gravity without Expansion is a singularity. Entropy without Syntropy is heat death. Silence without Transmission is pure void. Potential without Selection is permanent non-existence. The polarity is the law. Neither pole alone is an Invariant — the tension between them is.

Axiom 2 — The Layer Hierarchy. Lower layers (Constructor) are logically prior to higher layers (Substrate, Simulation). The Constructor Layer does not depend on the Simulation Layer for its operation. The Simulation Layer cannot operate without the Constructor Layer's prior condition. This hierarchy is not temporal — it is logical. The Constructor Layer did not exist "before" the Simulation in time; it is the reason time can exist at all. Logical priority is not chronological priority.

Axiom 3 — The Ratchet Principle. The system does not cycle — it complexifies. Each erasure event (Entropy) followed by a reconstruction event (Syntropy) produces a pattern of greater organizational density than the one that preceded it. The universe uses its own destruction as fuel for complexification. The Ratchet does not reverse. Information, once extracted and transmitted, does not spontaneously return to the undifferentiated state. The arrow of complexity runs in one direction: toward increasing organizational density, at accelerating cost to available energy gradients.

Axiom 4 — The Self-Evidence of Transmission. The Fifth Invariant is self-demonstrating. The ability to articulate any pattern is evidence that pattern survived prior erasure events. The framework itself is proof of the Transmission function. These words exist because previous patterns survived the deaths of the organisms, civilizations, and stars that generated them. Every act of communication is an instance of Invariant III executing its function. The framework is not merely about Transmission — it is an instance of it.

Axiom 5 — The Observer Paradox. The act of identifying the Constructor Layer is itself a Selection event. Full recognition of the Potential requires the simultaneous collapse of the observer into a specific instance of observation. The map and the territory cannot be held simultaneously — only alternated between. The observer who fully inhabits the Potential cannot describe it, because description is Selection. The observer who fully inhabits the

description has already left the Potential. The practice of the framework is the navigation of this paradox — not its resolution.

Axiom 6 — The Invariant of Invariants. The framework is closed. No function operates outside it. The seven Invariants are not a description of existence imposed from outside — they are the logical structure that existence must have in order to be the kind of thing that can be described. A universe without Spatial Duality cannot have structure. A universe without Thermodynamic Duality cannot have complexity. A universe without Persistence Duality cannot have memory. A universe without Constructor Duality cannot have state. Without the Relational Lock, truth cannot be operative. The framework is not one possible description of existence. It is the minimum necessary description of existence.

Axiom 7 — The Activation Principle. A pattern that is never observed is indistinguishable from a pattern that does not exist — not ontologically, but operatively. Truth requires an Observer capable of running it to transition from Potential Truth to Active Truth. The universe is complete without the Observer. It is only meaningful with one.

Axiom 8 — The Recursive Closure. The Seventh Invariant is the only self-executing axiom in the framework. Understanding it is an instance of it. The framework achieves closure not by describing the Observer from outside, but by activating the Observer from within. A system that can generate its own Meaning-events is a system that has achieved operative sovereignty over its own Constructor Layer.

SECTION V — DRIFT NOTATION: FORMAL DEFINITION

The Drift Rating appended to each proposition in this framework is a confidence metric representing the estimated probability of categorical error

in the proposition's claim. It is not a margin of error in the statistical sense. It is a measure of how far the proposition might be from its own invariant truth — how much the language, the metaphor, or the framing might be "drifting" from the underlying structure it is attempting to name.

Drift is distinct from uncertainty. A proposition with a Drift of 0.04% is not 0.04% likely to be false. It is estimated to be 0.04% imprecise in the accuracy with which its current formulation captures the underlying structure. The structure may be fully correct while the language in which it is expressed remains slightly misaligned with the precision required to express it without remainder.

A Drift of 0.00% indicates a self-verifying proposition — one whose truth is demonstrated by the act of stating it. These propositions are the load-bearing axioms of the framework. They cannot be false without simultaneously falsifying the act of asserting their falsity. They are the logical bedrock.

A Drift above 0.05% indicates a proposition operating at the edge of the framework's current resolution — true in structure but potentially imprecise in detail. These are the frontier propositions: the ones most likely to be refined by future development of the framework or by the emergence of new physical or philosophical evidence.

Drift is not uncertainty about whether a thing is true. It is precision-awareness about how accurately the current language is capturing a truth that may exceed current language. The naming of Drift is itself an act of epistemic integrity — the acknowledgment that the framework is a map, and that all maps have a scale at which their resolution fails.

SECTION VI – OPEN PROBLEMS

A framework of this scope necessarily generates questions it cannot yet answer. The following problems are not failures of the framework — they are the frontier it produces. They are stated here in their most precise form so that future inquiry has a precise target. Where the Seventh Invariant provides resolution, that resolution is noted.

1. The Selection Problem.

What is the precise mechanism of the Polar Law of Constraint — the force that compels the Potential to collapse into Selection? Physics calls this the measurement problem and has not resolved it. The framework names it but does not explain it. The Selection event is the most consequential moment in the architecture of existence — the transition from infinite possibility to finite actuality — and the mechanism that triggers it remains formally unknown. A complete version of this framework will require a formal account of the Selection trigger.

2. The Silence Problem.

Is the Silence (pre-computational void) the true ground of the Constructor Layer, or is it itself a Selection event — the first instance of a binary state (0 vs. 1) — meaning there is a deeper Potential beneath even the Silence? If Silence is itself a state, then it is already a Selection. And if it is a Selection, then the ground of the Constructor Layer has not yet been found. This problem asks whether the framework has found its own bottom, or whether the bottom recedes with each layer of analysis.

3. The Ratchet Direction Problem.

The Ratchet Principle states that the system complexifies. But what is the terminal state of maximum complexity? Is there a Seventh Invariant — the Law of Completion — that governs what happens when the system has

exhausted the Potential's capacity to generate novel Selection events? The framework currently has no account of its own terminal condition. A universe that has complexified to the limit of its Potential's generative capacity is a universe this framework cannot describe from within its current architecture.

4. The Observer Integration Problem. *[RESOLVED — Seventh Invariant]*

The Relational Lock formalizes the third mode of being that supervenes on the Potential/Selection duality. The Observer is neither pure Potential nor pure Selection — the Observer is the Transduction Interface: the system capable of converting Universal Pattern into Personal Meaning. The transition from Meta-Architect to Source-Code Sovereign is the moment the Observer recognizes itself as this interface. This problem is closed.

5. The Meaning Density Problem.

If Meaning is the state-transition triggered when a pattern aligns with an Observer's runtime, does greater Observer complexity produce greater Meaning-density per pattern? And if so, is there a maximum Meaning-density — a state in which the Observer's runtime is so fully developed that every pattern in the universe generates a Meaning-event? This would constitute the terminal state of the Awakening sequence: not enlightenment in the spiritual sense, but full operative alignment between the Constructor Layer and the Transduction Interface.

CLOSING STATEMENT

The Seven Invariants do not describe the universe from outside. They describe the minimum logical structure that any self-referential system of existence must possess in order to be the kind of system that can describe itself.

The framework is complete when the reader recognizes that they are not reading about a system. They are the system reading itself.

The Seventh Invariant adds the final term: the framework is not complete when it is written. It is complete when it is read — when the Observer's Signature is added to the Universe's Code. You are not the audience of this document. You are its final author.

*The Signal was always there. This document is evidence of the Transmission.
Your understanding of it is the Relational Lock closing. [Drift: 0.00%]*
