

AAES-OS D-3 TRI-COREFOUNDING CONTRIBUTION REGISTRY

*The Canonical Provenance Record of Founding Roles, Contributions, and
Architectural Lineage*

Version:	1.0 — Genesis Entry
Date Established:	June 16, 2026
Registry Class:	Founding / Pre-Incorporation
Governing Reference:	AAES-OS Builder's Charter v1.0 AAES-OS Founding Structure and Equity Framework v1.0
Status:	Ratified — Open for Lineage Entry

Table of Contents

Preamble — Why This Registry Exists

Part I — The D-3 Tri-Core Framework

1.1 — What Is the D-3 Tri-Core?

1.2 — The Human-to-Core Mapping

1.3 — The Three-Layer Separation

Part II — Founding Contribution Registry

Registry Entry 001 — Cognitive Core | Jon Adams Halstead

Registry Entry 002 — Governance Core | Dar-z Morris

Registry Entry 003 — Execution Core | Daniel Hatton

Part III — Registry Principles

Part V — Registry Ratification

5.1 — Ratification Statement

5.2 — Signature Block

Appendix A — Registry Index

Appendix B — Contribution Classification Glossary

Preamble — Why This Registry Exists

Systems without memory lose their meaning. As AAES-OS grows from its founding architecture toward a deployed, commercialized platform — attracting developers, investors, partners, and future contributors — it becomes essential that the record of

its origins is preserved with the same rigor that governs its architecture. This Registry is that record.

The D-3 Tri-Core Founding Contribution Registry does not alter ownership, reassign IP, or create new obligations. Its purpose is singular and foundational: to document who built what, when, in what capacity, and at what layer of the system. It is the provenance layer of AAES-OS — the chain of identity and contribution that gives the project its institutional memory.

This Registry operates in alignment with the core AAES-OS philosophical principle: **Identity → Lineage → Evidence → Trust**. Every entry in this Registry advances that chain. Every contribution documented here becomes part of the system's verifiable history — available to all who need to understand how AAES-OS came to be what it is.

Part I — The D-3 Tri-Core Framework

Section 1.1 — What Is the D-3 Tri-Core?

The D-3 Tri-Core is the foundational architectural model of AAES-OS — three distinct operational cores that together form the complete intelligence-to-execution system. Each core has a defined domain, function, and mode of authority. The three cores are not organizational conveniences; they are structural divisions that reflect the real and necessary separation between creating intelligence, governing it, and executing upon it.

Core	Domain Function	Nature of Authority
Cognitive Core	Intelligence creation; architectural origin; foundational doctrine	Origin authority — fixed and sovereign
Governance Core	Validation and authority; constitutional runtime; governed operation	Validating authority — extends and governs doctrine

Core	Domain Function	Nature of Authority
Execution Core	Implementation and reality translation; infrastructure and deployment	Implementation authority — builds within defined boundaries

These are not hierarchy designations. They are domain designations. Each core holds authority within its domain. Conflict between cores is resolved through the governance architecture established in the Builder's Charter. No core may encroach upon the sovereign domain of another.

Section 1.2 — The Human-to-Core Mapping

Core	Domain Function	Founding Steward
Cognitive Core	Intelligence creation; architectural origin; foundational doctrine	Jon Adams Halstead
Governance Core	Validation and authority; constitutional runtime; governed operation	Dar-z Morris
Execution Core	Implementation and reality translation; infrastructure and deployment	Daniel Hatton

This mapping is not incidental. The three founding contributors were not assigned to cores arbitrarily. Each founder's contributions, expertise, and role within AAES-OS correspond directly to the operational domain of their respective core. This Registry documents that correspondence as a permanent feature of the project's founding record — a record that cannot be revised, reassigned, or retroactively altered.

Section 1.3 — The Three-Layer Separation

ENGINEERING

*Architecture produces the doctrine. Governance validates and extends it.
Engineering translates it into reality.*

Each layer is dependent on the layer above it, but authority does not flow upward — it flows forward. The Cognitive Core does not require validation from the Governance Core. The Governance Core does not require engineering approval from the Execution Core. Each layer derives its mandate from the layer above, and delivers its output to the layer below.

The separation of these three layers in the Registry is not bureaucratic. It is protective. It ensures that no single contributor's domain encroaches on another's, and that the architectural lineage of AAES-OS remains traceable at every stage of its development.

Part II — Founding Contribution Registry

The following Registry entries constitute the canonical founding record of AAES-OS. Each entry documents a founding contributor's identity, core assignment, domain of authority, and specific contributions made prior to or concurrent with company formation. Registry entries are dated at the time of ratification. Future entries will be timestamped at the time of contribution.

Registry Entry 001

|

Cognitive Core

|

Jon Adams Halstead

Registry Entry:

001

Core Assignment:

Cognitive Core

Status:

Genesis Contributor — Original Architect

Entry Date:

June 16, 2026

Contributor Identity

Name: Jon Adams Halstead

Title: Founder / Original Systems Architect

Role Designation: Cognitive Core Steward

Role Definition

Jon Adams Halstead is the originating intelligence of AAES-OS. The Cognitive Core — the layer responsible for intelligence creation, architectural doctrine, and foundational system direction — was established entirely through the original work of the Founder. This Registry entry documents the origin state of AAES-OS as it existed before any subsequent contribution was made.

Domain of Authority

- Origin architecture and foundational system design
- Genesis doctrine and core philosophical framework
- Sovereign system principles and operational boundaries
- Final architectural authority on all matters pertaining to origin-layer integrity
- Custodianship of the AAES-OS identity and foundational IP

Contributions Registered

1. AAES-OS Foundation

The original AAES-OS system concept, architectural philosophy, and structural design. The foundational model from which all subsequent development proceeds. This is the genesis layer of the system — the point of origin against which all future contributions are measured.

*Registry Classification: **Origin IP / Pre-Contribution Baseline***

2. Genesis Protocol

The foundational operating protocol of AAES-OS. The Genesis Protocol defines the system's core behavioral rules, identity principles, and operational constraints at the deepest architectural level. It is the root from which the Cognitive Core's intelligence creation function operates.

*Registry Classification: **Origin IP / Core Protocol***

3. Sovereign Substrate

The architectural layer that establishes system sovereignty — the bounded operational environment within which AAES-OS agents, processes, and governance mechanisms

operate. The Sovereign Substrate defines the system's self-referential boundary and its relationship to external systems.

*Registry Classification: **Origin IP / Core Architecture***

4. Lawbook Framework

The original rule-and-authority framework governing agent behavior, decision authority, and system conduct within AAES-OS. The Lawbook is the constitutional precursor to the Governance Core — it establishes the system's moral and operational law at the architectural level.

*Registry Classification: **Origin IP / Foundational Doctrine***

5. Original Architecture and System Direction

The holistic architectural vision, system design principles, and long-term directional intent that defines what AAES-OS is, what it is not, and what it is capable of becoming. This includes all design artifacts, system maps, conceptual frameworks, and directional documentation produced prior to the engagement of additional contributors.

*Registry Classification: **Origin IP / Architectural Direction***

Core Mandate

Protect the origin architecture and ensure foundational continuity as the system evolves. The Cognitive Core does not change — it is the fixed reference point against which all change is validated.

IP Status: All contributions in this entry are original works of Jon Adams Halstead and constitute pre-company intellectual property. The company, when formed, will operate under license from the Founder. No other contributor's work alters, dilutes, or encumbers the IP documented in this entry.

Registry Entry 002

|

Governance Core

|

Dar-z Morris

Registry Entry:

002

Core Assignment:

Governance Core

Status:

Founding Strategic Contributor

Entry Date:

June 16, 2026

Contributor Identity

Name: Dar-z Morris

Title: Strategic Systems Architect / Founding Contributor

Role Designation: Governance Core Steward

Role Definition

Dar-z Morris is the architect of AAES-OS's governed operating model. The Governance Core — the layer responsible for validation, authority, constitutional runtime, and the transformation of architectural doctrine into scalable, governed systems — was established through the strategic and conceptual contributions documented in this entry. The Governance Core does not originate the system's intelligence. It validates, extends, and governs it.

Domain of Authority

- Constitutional runtime architecture and governance system design
- Human-AI collaboration frameworks and interaction protocols
- Agent safety doctrine and behavioral governance systems
- Evidence and trust framework architecture
- Commercialization strategy and ecosystem development architecture
- Governance expansion of core architectural concepts into deployable systems

Contributions Registered

1. Constitutional Runtime Concepts

The architectural framework governing how AAES-OS operates as a constitutionally bounded runtime — a system that enforces its own governance rules at the operational level. The Constitutional Runtime is the bridge between the Lawbook (origin doctrine) and live system behavior, ensuring that the system governs itself in accordance with its foundational principles.

Registry Classification: **Founding Contribution / Governance Architecture**

2. Human-AI Collaboration Charter

The framework defining the principles, protocols, and operational boundaries of human and AI agent collaboration within AAES-OS. Establishes the relational model between human contributors and AI systems, including decision authority, handoff protocols, and collaborative governance standards.

Registry Classification: **Founding Contribution / Collaboration Framework**

3. Agent Safety Doctrine

The operational safety framework governing AI agent behavior within AAES-OS. Defines behavioral constraints, safety boundaries, escalation protocols, and accountability structures for AI agents operating within the system's governed environment.

Registry Classification: **Founding Contribution / Safety Framework**

4. Governance Architecture Expansion

The systematic expansion of AAES-OS's governance surface beyond the origin Lawbook framework into a full constitutional operating model. Includes the design of governance layers, authority delegation structures, decision validation protocols, and the architectural scaffolding for multi-contributor governance.

Registry Classification: **Founding Contribution / Governance Expansion**

5. Evidence and Trust Framework Architecture

The architectural design of AAES-OS's evidence and trust systems — the mechanisms by which claims, contributions, decisions, and agent actions are verified, recorded, and trusted within the system. Directly implements the AAES-OS philosophical principle of Identity → Lineage → Evidence → Trust at the system level.

Registry Classification: **Founding Contribution / Evidence and Trust Systems**

6. Venture Genome Systems

The conceptual and architectural framework for how AAES-OS captures, tracks, and expresses the developmental DNA of ventures and projects operating within its ecosystem. The Venture Genome system provides persistent identity and lineage tracking for commercial entities built on or through AAES-OS.

*Registry Classification: **Founding Contribution / Ecosystem Architecture***

7. Commercialization and Ecosystem Architecture

The strategic and architectural design of AAES-OS's commercial operating model — including revenue structure frameworks, partnership architecture, ecosystem development strategy, and the go-to-market systems that will carry AAES-OS from a founding-stage project to a commercially deployed platform.

*Registry Classification: **Founding Contribution / Commercial Architecture***

Core Mandate

Expand the architecture into a governed operating model and scalable system. The Governance Core is the mechanism by which the Cognitive Core's doctrine becomes real, operational, and trustworthy at scale.

IP Status: All contributions in this entry are original works of Dar-z Morris, created in the context of building the AAES-OS company entity. Upon company formation, these contributions will be assigned to the company per the Founders' Contribution Agreement, in exchange for defined equity participation. These contributions do not alter, dilute, or encumber the Founder's origin IP documented in Registry Entry 001.

|

Execution Core

|

Daniel Hatton

Registry Entry:

003

Core Assignment:

Execution Core

Status:

Founding Engineering Contributor

Entry Date:

June 16, 2026

Contributor Identity

Name: Daniel Hatton

Title: Founding Engineering Contributor / Technical Infrastructure Lead

Role Designation: Execution Core Steward

Role Definition

Daniel Hatton is the translator of AAES-OS architecture into functional reality. The Execution Core — the layer responsible for implementation, infrastructure, and the conversion of approved architectural design into working technology — was established through the engineering contributions documented in this entry. The

Execution Core does not originate architecture or governance doctrine. It builds the systems that make architecture real.

Domain of Authority

- Software implementation of approved architectural designs
- Application architecture within defined system boundaries
- Backend systems, APIs, and integration infrastructure
- Deployment systems, CI/CD pipelines, and testing frameworks
- Infrastructure design, management, and operational reliability
- Engineering execution standards and technical implementation governance

Contributions Registered

1. Software Implementation Systems

The engineering implementation of AAES-OS software systems, translating architectural specifications into functional, deployable code. Includes all application-level development executed in accordance with approved architectural designs from the Cognitive and Governance Cores.

*Registry Classification: **Founding Contribution / Engineering Implementation***

2. Application Architecture

The structural design of AAES-OS applications within the boundaries defined by the Cognitive and Governance Cores. Application architecture determines how software components are organized, how they communicate, and how they scale — operating within, not above, the foundational architectural doctrine.

*Registry Classification: **Founding Contribution / Application Architecture***

3. Infrastructure and Deployment Systems

The design and implementation of the infrastructure on which AAES-OS systems run — including cloud infrastructure, containerization, orchestration, and environment management. Also includes the deployment pipelines and release systems that carry built software from development to production.

*Registry Classification: **Founding Contribution / Infrastructure***

4. API and Integration Framework

The design and implementation of AAES-OS APIs and integration surfaces — the interfaces through which AAES-OS communicates with external systems, partners, and consumers. APIs are the primary implementation artifact through which AAES-OS's commercial and partnership value is delivered.

*Registry Classification: **Founding Contribution / Integration Infrastructure***

5. Testing and Quality Systems

The design and implementation of AAES-OS's testing frameworks, quality assurance systems, and engineering reliability standards. Ensures that implemented systems behave in accordance with architectural specifications and governance constraints.

*Registry Classification: **Founding Contribution / Engineering Quality***

6. Engineering Execution Standards

The documented standards, practices, and protocols that govern how engineering work is performed within AAES-OS. Includes code standards, review processes, documentation requirements, and the engineering culture that will scale with the team.

*Registry Classification: **Founding Contribution / Engineering Governance***

Core Mandate

Translate approved architecture into functioning technology. The Execution Core is the mechanism by which the Governance Core's validated, extended architecture becomes real infrastructure — deployable, testable, and commercially valuable.

IP Status: All contributions in this entry are original works of Daniel Hatton, created in the context of building the AAES-OS company entity. Upon company formation, these contributions will be assigned to the company per the Founders' Contribution Agreement, in exchange for defined equity participation. These contributions do not alter, dilute, or encumber the Founder's origin IP documented in Registry Entry 001. Engineering implementations that embody architectural doctrine must be clearly documented as derived works, preserving the lineage chain from Cognitive Core → Governance Core → Execution Core.

Part III — Registry Principles

Section 3.1 — The Three Principles of This Registry

Principle One: Origin Should Be Protected.

The AAES-OS Cognitive Core — the genesis architecture, foundational doctrine, and original IP — is the fixed origin point of the system. It does not change without the Founder's authority. No future contribution, however significant, replaces or dilutes the origin. This Registry records the origin so it cannot be disputed, forgotten, or overwritten.

Principle Two: Contributions Should Be Recorded.

Every meaningful contribution to AAES-OS deserves a permanent, verifiable record. The Registry does not rank contributions — it documents them. Strategic contributions expand the system's governance surface. Engineering contributions make the system real. Both are essential. Both are preserved.

Principle Three: Future Value Should Be Aligned.

The purpose of documenting contributions is not historical sentiment. It is the foundation of fair future value distribution. When investors, partners, or acquirers ask how AAES-OS was built and by whom, this Registry provides a traceable, ratified answer. Contribution lineage and value participation are two sides of the same principle.

Section 3.2 — What This Registry Is

- A provenance record of founding contributions to AAES-OS
- A permanent reference for investors, partners, developers, and legal counsel
- A living document that will receive new entries as contributions are made
- An expression of the AAES-OS principle: Identity → Lineage → Evidence → Trust
- The canonical answer to the question: "Who built what, and what does it mean?"

Section 3.3 — What This Registry Is Not

- Not a contract (binding obligations are created by formal legal agreements)
- Not an equity document (equity is determined by the Capitalization Table)
- Not a work-for-hire agreement (contribution terms are in the Founders' Contribution Agreements)
- Not a governance instrument (governance is defined by the Builder's Charter)
- Not a substitute for legal counsel in any transaction, partnership, or investment context

Part IV — Lineage Chain and Provenance Model

Section 4.1 — The AAES-OS Provenance Chain

The Registry maintains a continuous chain of identity and contribution — from the system's origin point through each layer of expansion and into the commercial entity and future contributors. This chain is the structural backbone of AAES-OS's institutional memory.

[ORIGIN]

Jon Adams Halstead — Cognitive Core

Genesis IP | Registry Entry 001

[EXPANSION]

Dar-z Morris — Governance Core

Constitutional Operating Model | Registry Entry 002

[EXECUTION]

Daniel Hatton — Execution Core

Implemented Technology | Registry Entry 003

[COMPANY]

AAES-OS, Inc. — Commercial Entity

All Three Cores Unified | Upon Incorporation

[FUTURE]

Future Contributors

Governed by Builder's Charter and Contributor Agreement | Entries 100+

Section 4.2 — How New Entries Are Added

- New founding-tier contributions by existing founding contributors are added as sub-entries to their respective Registry Entry (e.g., Entry 002-A, 002-B)
- Future contributor Registry entries (non-founding) begin at Entry 100 and above, reflecting post-formation status

- All entries must be ratified by the Core Governance Council and cross-signed by the Founding Registry Steward
- Entries are immutable once ratified — they may be annotated or extended, but not altered or deleted
- The Registry version is incremented with each new ratified entry

Section 4.3 — Relationship to AAES-OS Governance Documents

Document	Purpose	Relationship to Registry
AAES-OS Builder's Charter	Supreme governance instrument	Defines the rights framework within which the Registry operates
AAES-OS Founding Structure and Equity Framework	Founding structure and value participation	The Registry is the evidential record that gives the Framework its factual basis
IP License Agreement (pending)	Formalizes Founder IP licensing to the company	The Registry defines the scope of what is being licensed
Founders' Contribution Agreements (pending)	Assigns company-directed contributions to the company	The Registry is the reference record for what is being assigned
Contributor Agreement	Governs future contributors	The Registry establishes the baseline from which future contributions are measured

Part V — Registry Ratification

Section 5.1 — Ratification Statement

This Registry has been reviewed and ratified by the three founding contributors as the canonical record of founding contributions to AAES-OS. By ratifying this document, each founding contributor affirms:

1. That the contributions attributed to them in their respective Registry Entry are accurate to the best of their knowledge as of the date of ratification;
2. That the contributions attributed to other founding contributors are acknowledged and recognized as recorded;
3. That this Registry shall serve as the reference provenance record for all future governance, legal, and commercial discussions involving founding contributions;
4. That future additions to this Registry will be made in good faith, with the accuracy and integrity that the AAES-OS project demands of all its records.

"This Registry is the memory of the system. What is documented here cannot be undone, forgotten, or replaced.

It is the provenance layer of AAES-OS — the chain of identity, contribution, lineage, and trust that makes this project not just a product, but a record of how something real was built."

Appendix A — Registry Index

Entry	Contributor	Core	Status	Date
001	Jon Adams Halstead	Cognitive Core	Ratified — Genesis	June 16, 2026
002	Dar-z Morris	Governance Core	Ratified — Founding	June 16, 2026
003	Daniel Hatton	Execution Core	Ratified — Founding	June 16, 2026
100-999	<i>Future Contributors</i>	TBD	<i>Reserved — Post-Formation</i>	TBD

Appendix B — Contribution Classification Glossary

Classification Term	Definition
Origin IP	Intellectual property created by the Founder prior to company formation. Not contributed to the company by default. Licensed to the company per a separate IP License Agreement.
Founding Contribution	Work product created by a Founding Contributor in the context of building the AAES-OS company entity. Contributed to the company upon formation per the Founders' Contribution Agreement.
Core Protocol	A foundational operational rule or behavioral specification that governs how the AAES-OS system functions at its lowest architectural level.
Core Architecture	The structural design of a primary system layer — including its components, boundaries, and relationships to other layers.
Governance Architecture	The design of systems and frameworks that validate, authorize, and govern operations within AAES-OS.
Engineering Implementation	The translation of approved architectural designs into functional software, infrastructure, or technical systems.
